

ANTONIO DÍAZ

Software developer

Typescript + Rust

Software developer with 9+ years of experience on frontend using TypeScript and React, and on backend with NodeJS, Rust and Golang.

Since 2015 I have been working on full stack roles related to web software development with multinational teams across wide time zones. Some of the sites I have worked on include the multinational streaming platform from Telefónica Movistar Plus+, the ecommerce based in Los Angeles *Thrive Market* or the site for the design studio *Linii*.

In 2012 I co-founded *Díaz & Pons*, publishing house focused on digital and printed editions, where we edited high quality non-fiction books on art and social sciences. There I directed content and personally designed every book's interior—typography, layout, and composition— which gave me a strong eye for visual detail and visual language.

I care about craft in frontend work, with a special focus on typography and design systems that scale across teams. Recently I have been integrating a multilingual international streaming service with 1M+ concurrent plays into the main streaming platform Movistar Plus+. This has involved a complete redesign of the platform, merging the business logic of both services, dealing with scale and security challenges, refining product details, and coordinating across engineering, design, and product teams to solve problems that cut across organizational boundaries.

I am open to roles related to web software development with TypeScript or Rust. You can find more information at my site www.antoniodiaz.me, in my *Gitlab*|*GitHub*, or by writing to hello@antoniodiaz.me.
